

FRESH CUT FLOWERS

When purchasing or receiving cut flowers, we want them to last as long as possible. There are proper steps we can take to lengthen the life of our flowers. When placing the flowers into a vase, recut about 1 inch off the stems underwater. Remove any foliage below the level of water. Preservative packets are available to mix with the water. It is best that this water is a warmer temperature. Do not place the flowers in direct sunlight or near extremes of hot and cold such as a heater vent or a drafty window. Dying blooms and foliage may be removed at any time. The stems can also be recut every 4 to 5 days to encourage better water uptake. Fresh water and a new preservative packet can also be used at this time. Do not display the flowers near fruits or vegetables. The ethylene gas they give off effects flower life. Always use a clean vase for each flower display. The following is a list of flowers available at our Flower Shoppe. Stop by and enjoy!
